1. CS 6457 Video game design course in a team of 5, Georgia Tech, 2018

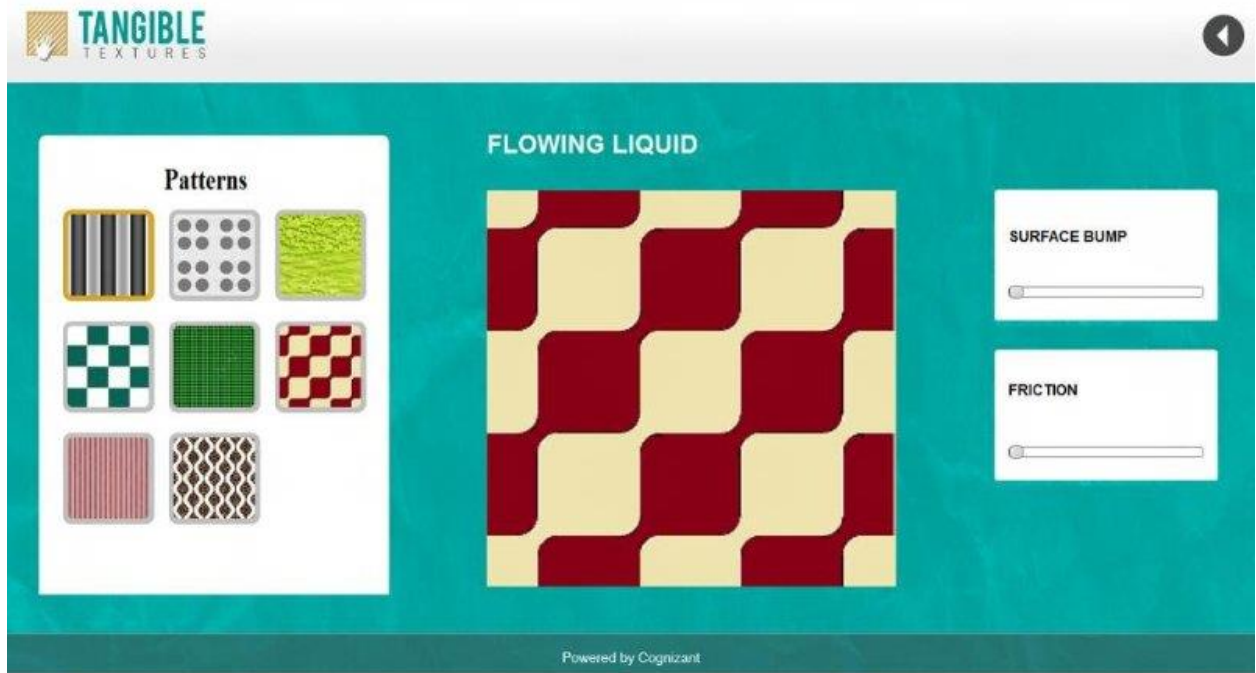

This is an underwater game developed on Unity and requires the player to solve different underwater mysteries and hurdles to collect fishes. When the player attains a required school size, he can defeat the predator.

2. **OpenCV and haptics based image segregation, Cognizant, 2015**

Developed an application for converting image data of wall texture designs in real time into customizable haptic surfaces. Proved at least 15% reduction in shipping costs for a paints manufacturing client and 90% approval of end users for touch accuracy of textures. Published work in IEEE.

3. Stroke rehabilitation platform, IIT Gandhinagar, India, 2014

Demonstrated at least 50% cost efficiency and marginal improvement in coordination skills of upper limb impaired stroke patients with a virtual reality treatment.

Designed and developed a virtual environment wherein patients maneuver a car on 6 different tracks of varying shapes and difficulty. Used Vizard by Worldviz with a joystick and haptic device, Phantom Omni.

4. Kinect based trial room, Cognizant, 2016.

Designed and developed a walk-in apparel trial kiosk for shoppers to try clothes in real time. The gesture-controlled app developed in unity has real time size detection and cloth simulation.
